E-COMMERCE SALES DATA

DESCRIPTION:

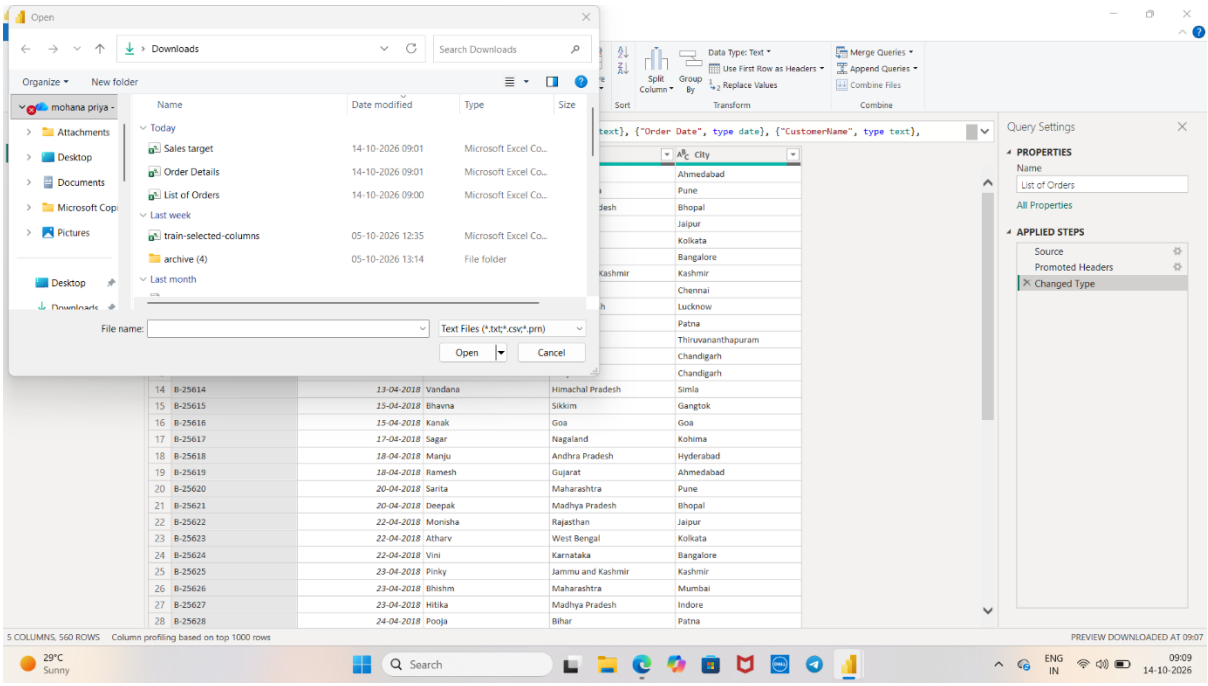

This project involves preparing and analysing sales data using Power BI. It includes data cleaning, data transformation, data merging, data aggregation, and data modelling to improve data quality and generate meaningful insights into sales performance, profit, and sales targets.

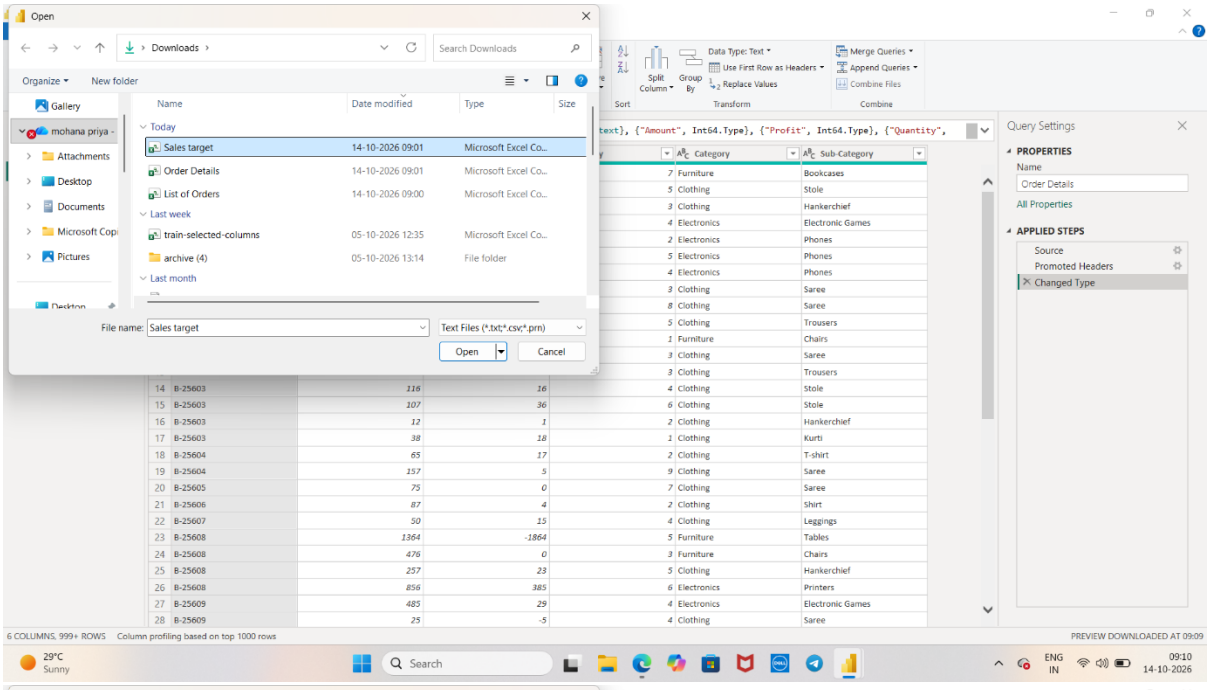

COLUMN DESCRIPTION:

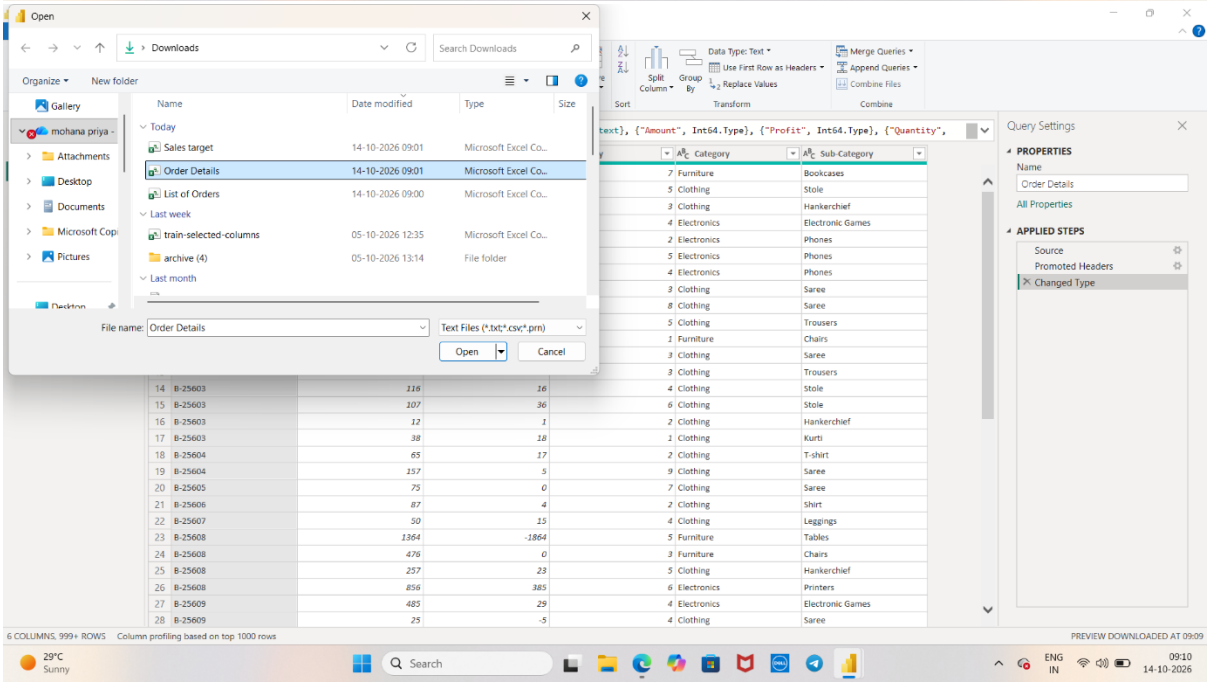

- LIST OF ORDERS
- ORDER DETAILS
- SALES TARGET

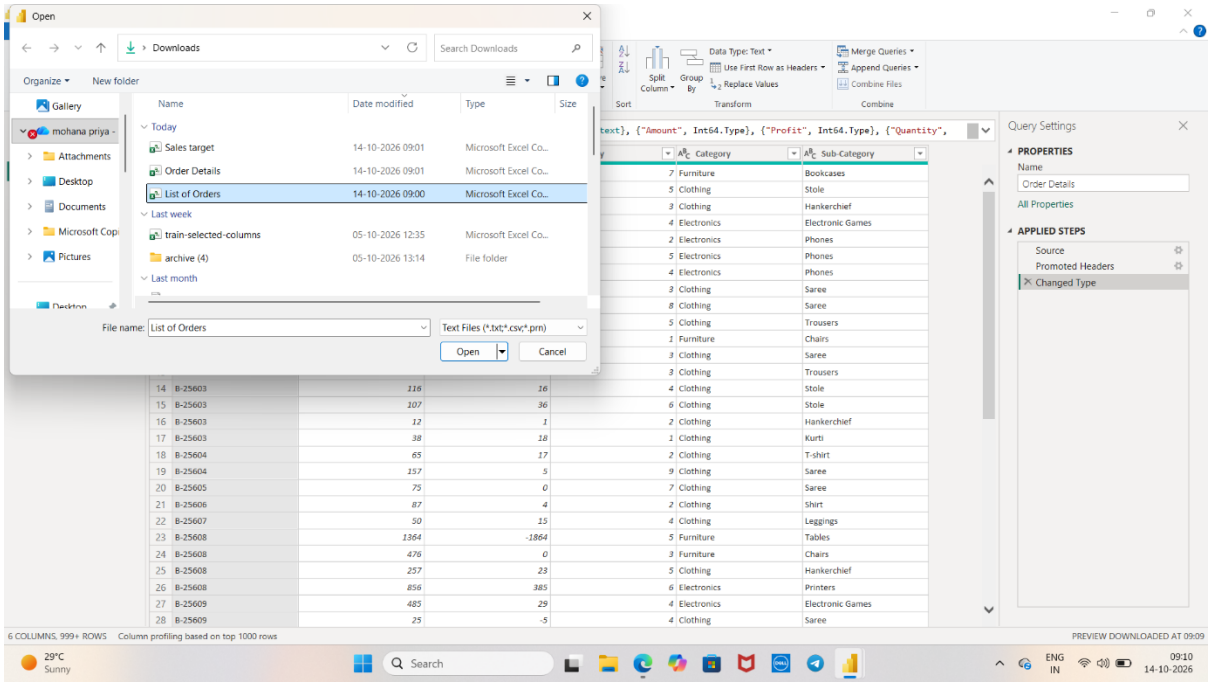

TASK DATA IMPORT & TRANSFORMATION:

1.Import the data:

2. Restrict the List of Orders table to the first 500 rows:

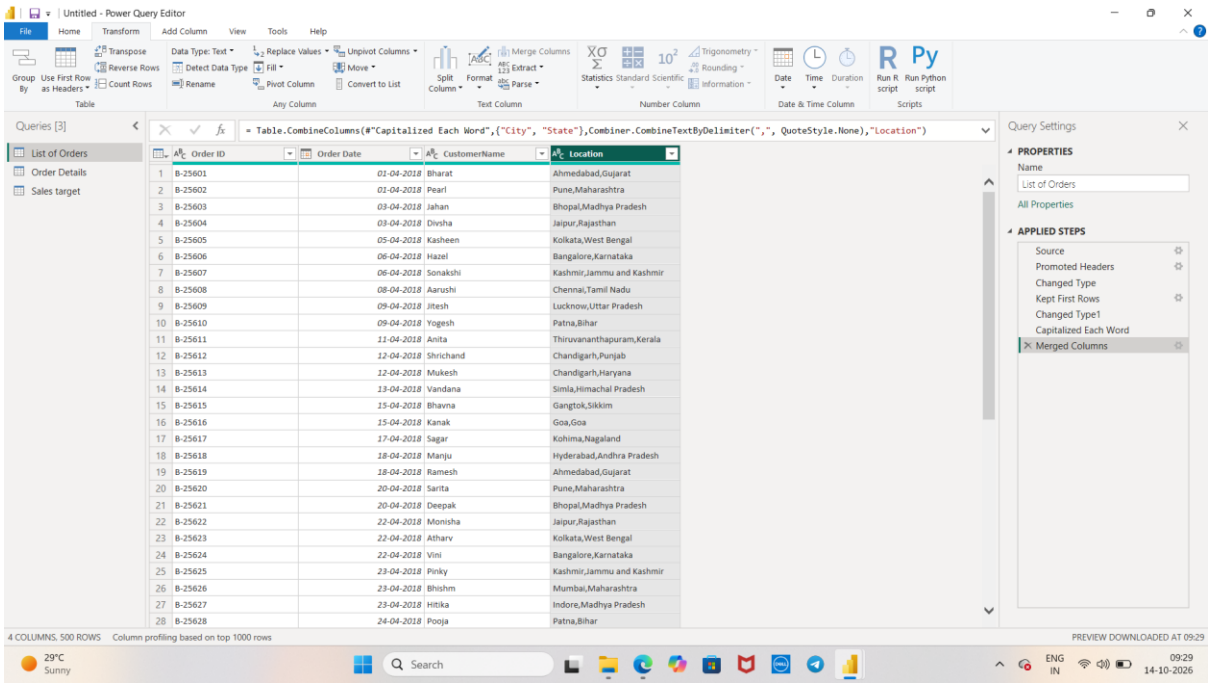

3. Change the Amount and Target columns to fixed decimal numbers:

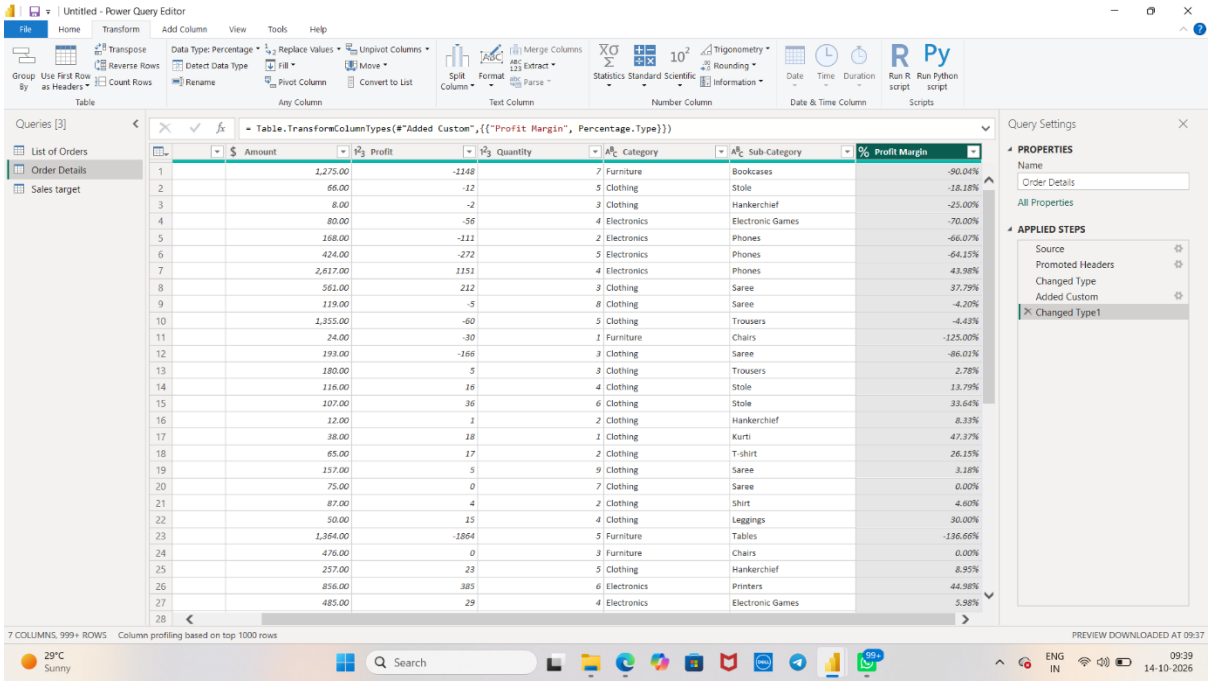

4. Format the Customer Name column to proper case to ensure consistent capitalization :

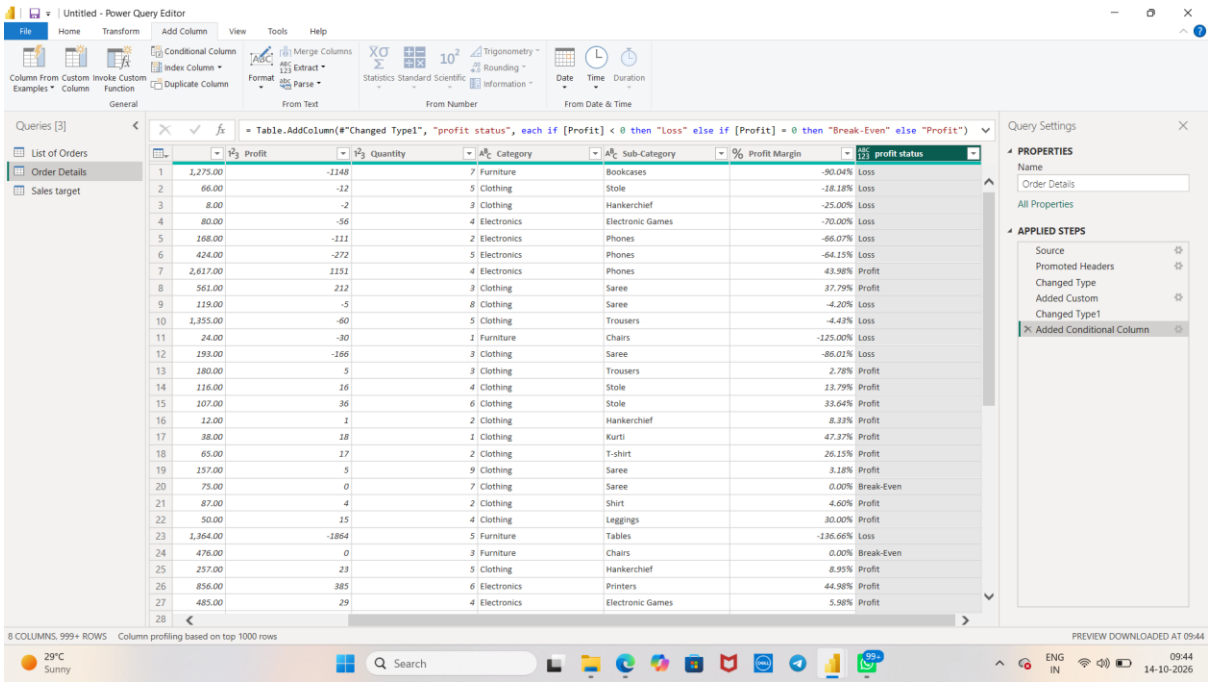

5. Merge the City and State columns to create a new column named Location in the format:

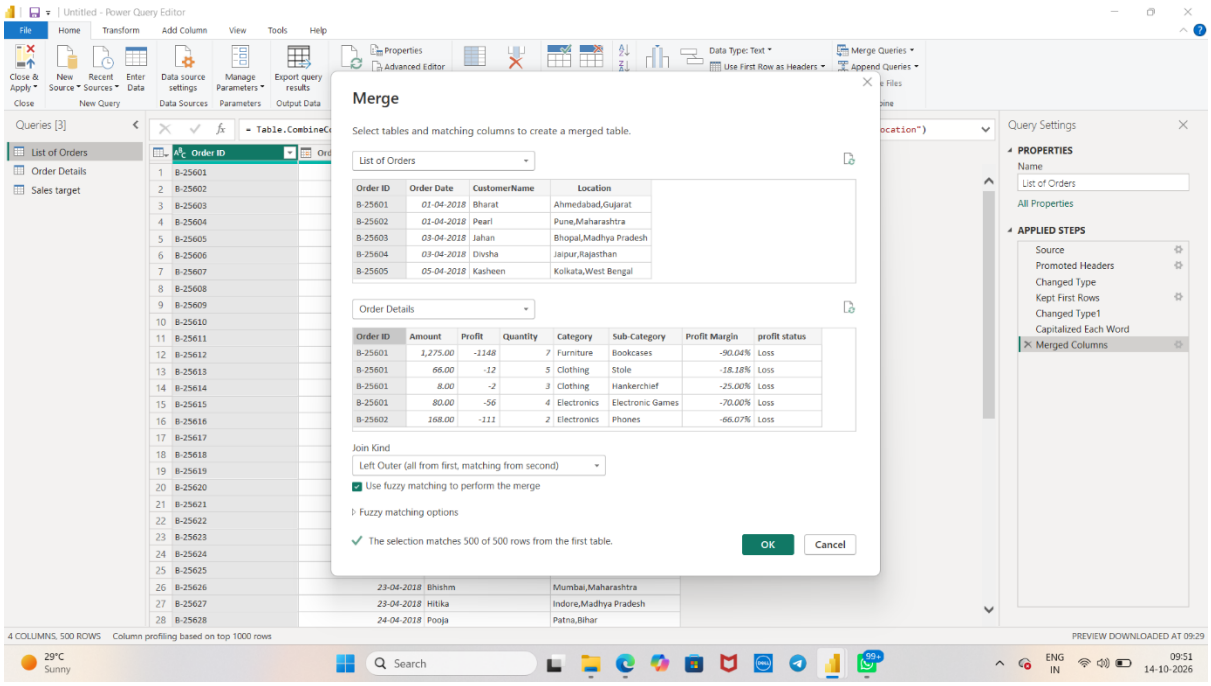

6. Create a custom column named Profit Margin calculated as: Profit / Amount (expressed as a percentage):

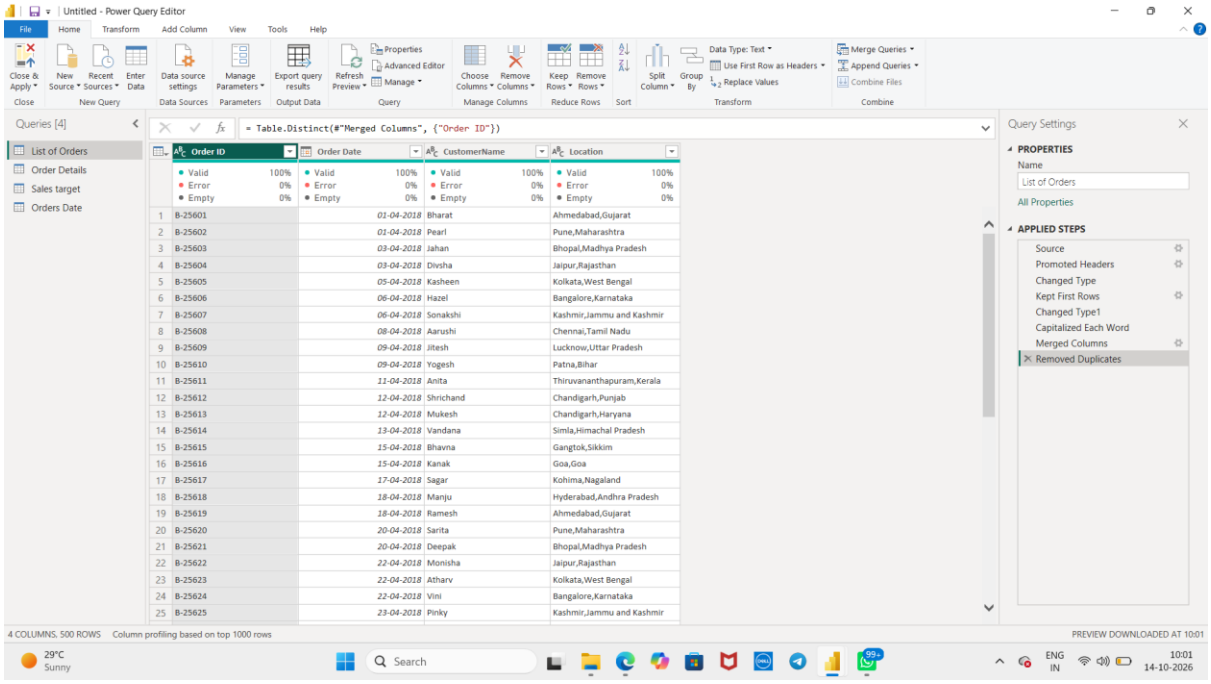

7. Add a conditional column named Profit Status based on (Profit , Loss, Break-Even) :

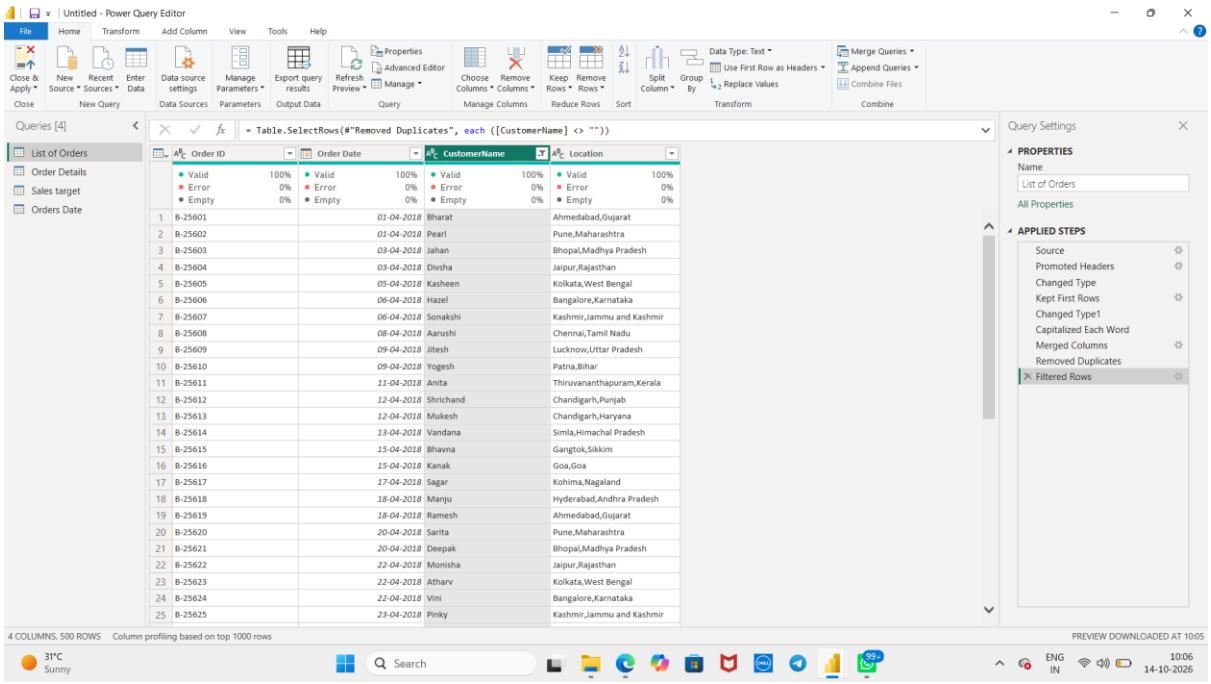

8. Merge the List of Orders and Order Details tables using Order ID:

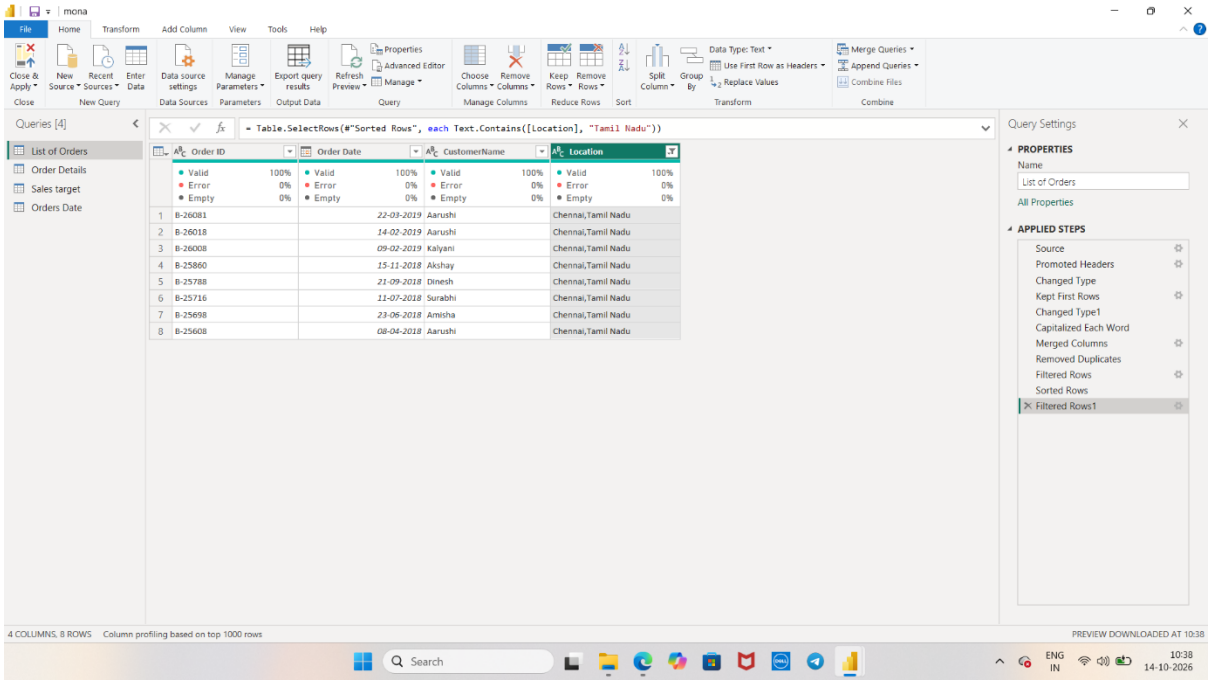

9. Identify missing values across all tables:

10. Sort records in the Orders Data table by Order Date in descending order:

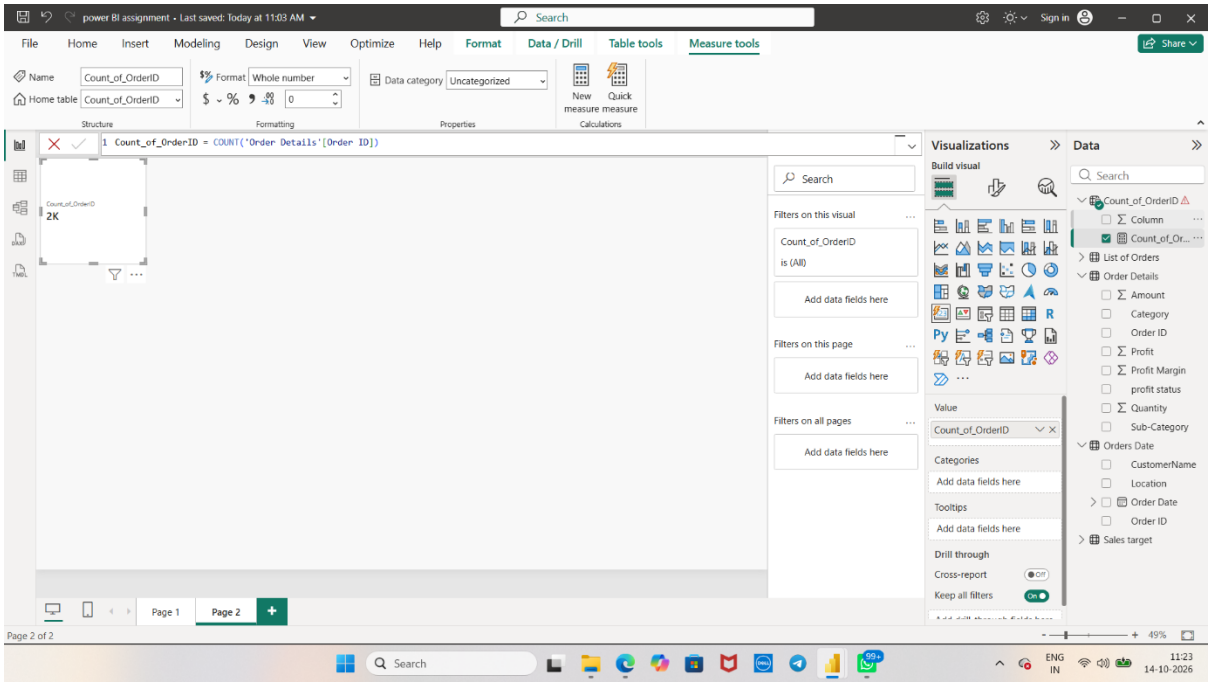

11. Apply filters to analyze orders from a specific state:

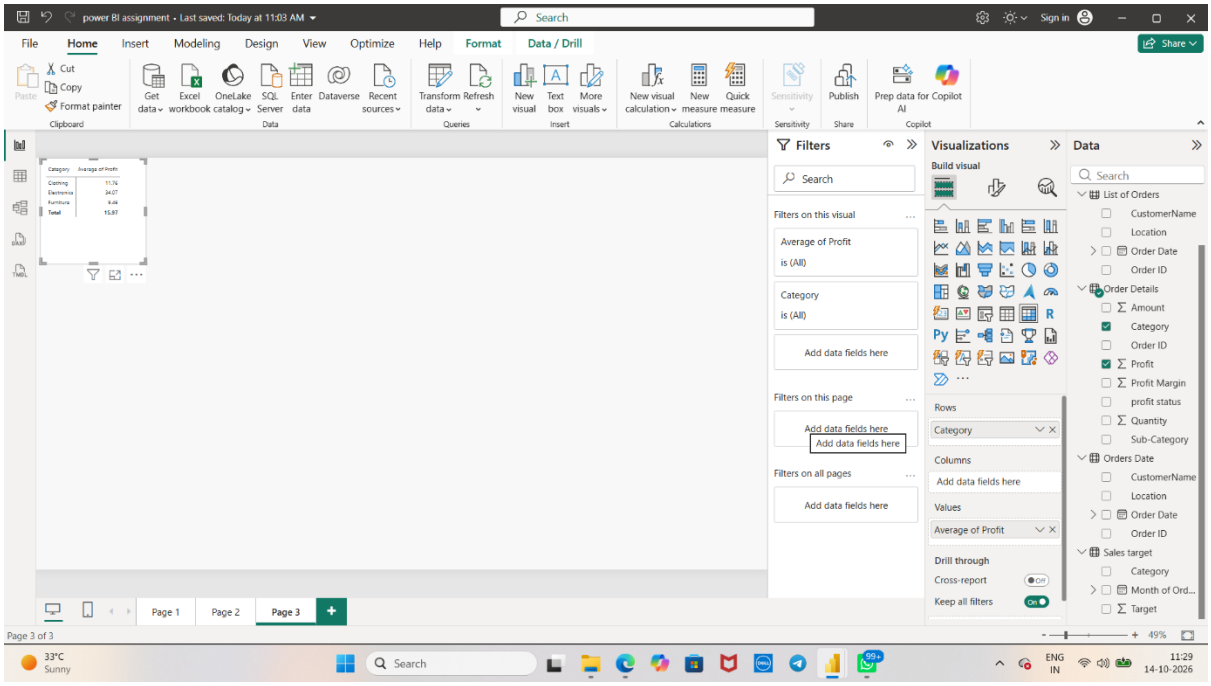

12. Duplicate the Order Details table and perform the following:

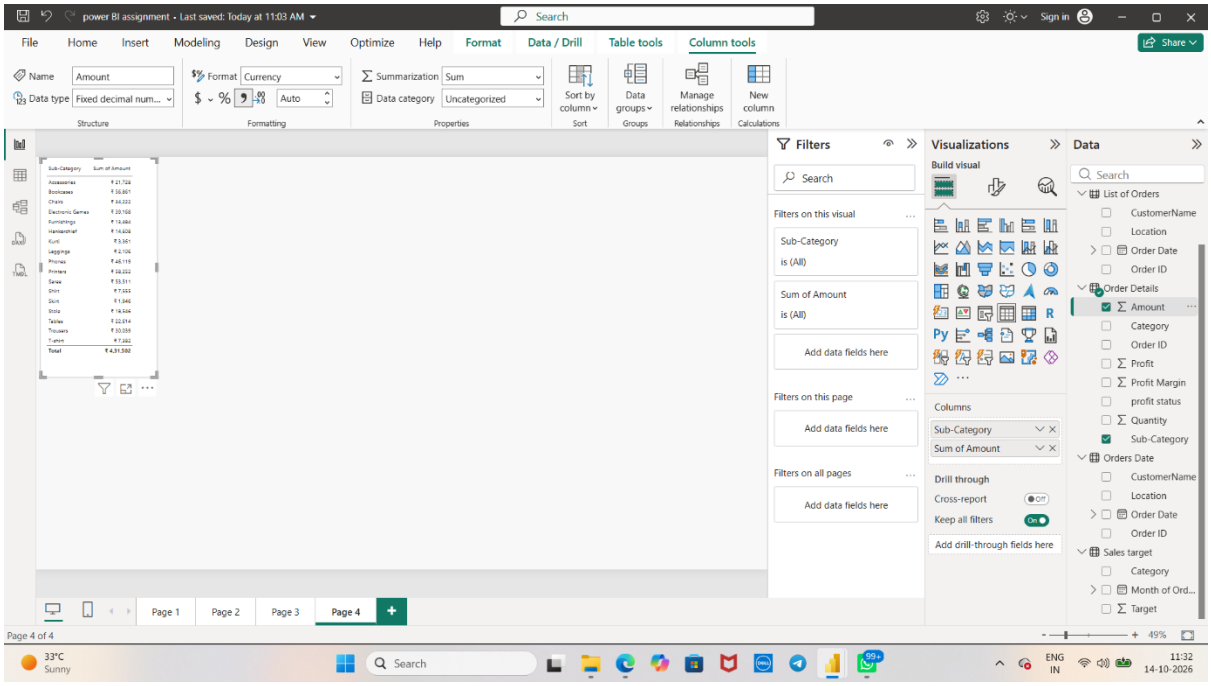

A.Count of Order ID

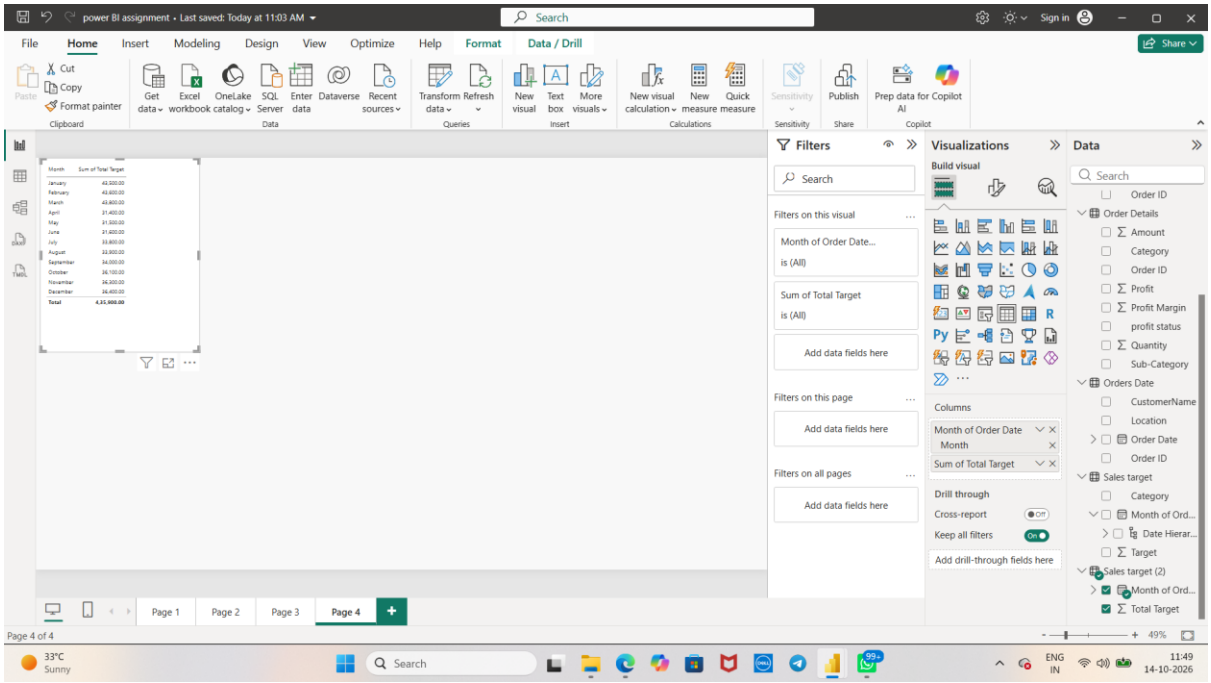

B. Average Profit by Category:

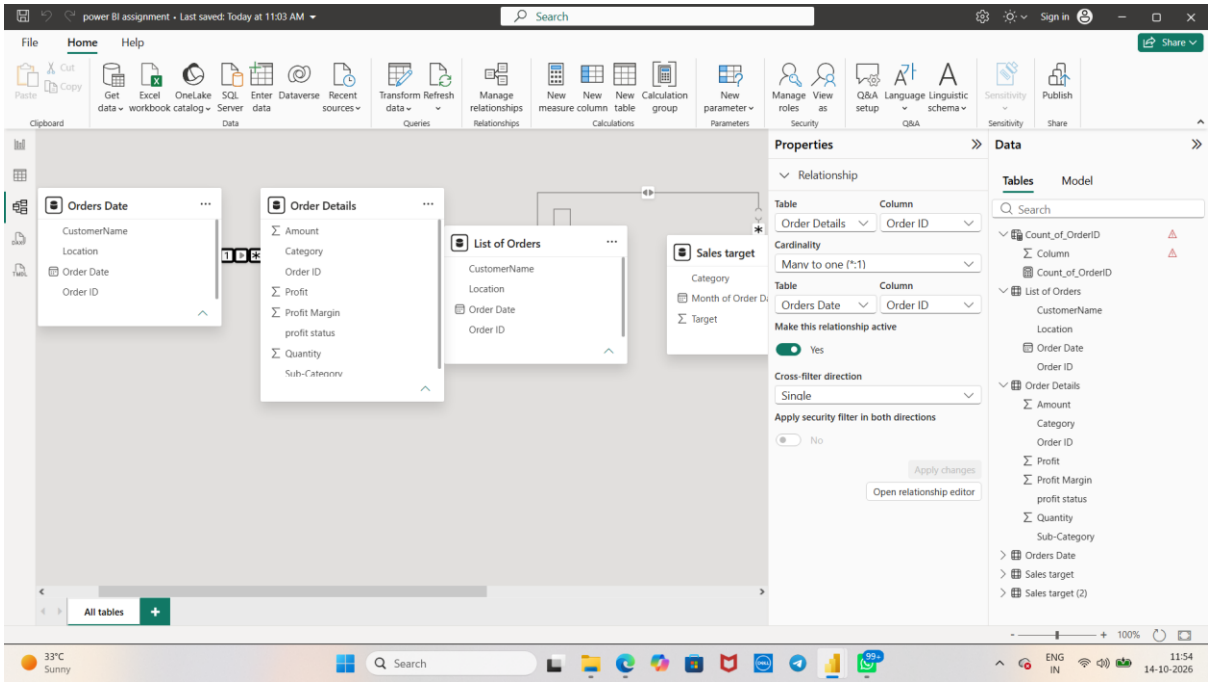

C. Total Amount by Sub-Category:

D.Duplicate the Sales Target table and aggregate the total Target by Month of order date:

E. Use Manage Relationships to ensure relationships are active:

CONCLUSION:

This project aims to organize, transform, and analyse sales data using Power BI. It covers essential processes such as data cleaning, data transformation, data merging, data aggregation, and data modelling. These techniques help ensure data accuracy and provide valuable insights into sales trends, profit analysis, and target performance.
